The NACEComm completely customizable channel guide supports listings for both digital and analog channels. Once a day the server remotely updates and downloads TV listing data for the channels that you carry. Listings data covers everything from major networks to local public access channels. The NACEComm channel guide is perfect for headend systems with no other source of guide data including analog systems, standard definition digital systems, high definition digital systems and IP based systems. The system was designed for use in hotels, retirement communities, universities, prisons and hospitals but can be used in almost any headend or private cable system with the addition of the appropriate modulator.
